

BoKS Reporting Manager, an optional enhancement to BoKS Access Control Management solutions, enables organizations to manage audit and compliance reporting in a secure, structured way across security domains. BoKS Reporting Manager can be remotely managed and operated from any configured client via an internet browser.

In addition to simplifying audits and regulatory compliance, BoKS Reporting Manager also boosts administrator productivity with improved views into access control policies. And for security and IT management, consolidated visibility into the status of your access controls across domains facilitates pro-active decision making.

BoKS Reporting Manager's key features include:

- Role-based access to compliance, audit, and operational reporting capabilities
- Delivery of business and operational views into your corporate access control policies and audit log data
- Access to compliance report data is automatically segregated from your operational security environment
- Pre-built set of 50+ standard security reports, appropriate to your BoKS Access Control infrastructure
- Ability to review and report on access control policies and data across security domains
 - To meet regulatory requirements, it is common to divide operational security along "Chinese Walls" principles with separate security domains
 - However, from a business perspective, it is important to have visibility across domains at a summary level
 - BoKS Reporting Manager supports data access controls to meet both sets of business imperatives
- Trend graphing enables management to quickly assess system activity (e.g. logins, failed logins)
- Data sets from other on-site databases (for example, asset management) may be integrated with your corporate access controls and audit logs

BoKS Reporting Manager is designed for use in highly scalable, enterprise environments. The two industry-standard components include:

- Web application server platform based on either IBM WebSphere, Oracle Weblogic, or Apache Tomcat
- Database platform based on either Oracle or MySQL Enterprise platforms

About FoxT

BoKS FoxT's comprehensive Enterprise Access Control Management solution suite enables organizations to centrally manage and control access to operating system services, configuration services, business applications, and information, on wired or wireless devices. The ability to centrally administer, authenticate, authorize, and audit the IT infrastructure enables organizations to simplify audits and compliance, strengthen security, and streamline IT operations. Headquartered in Mountain View, California, FoxT serves Global 1000 customers in 32 countries For more information - www.foxt.com.

Supported Platforms

BoKS Manager Version Support

BoKS Reporting Manager integration can be connected to all BoKS Masters running the following releases:

BoKS 6.5.1 and newer for Sun Solaris 9, Sun Solaris 10, and Red Hat Enterprise Linux 5 64-bit

Please check with your Technical Account Manager for platform and release combinations.

BoKS Reporting Manager Platform Support

- Redhat Enterprise Linux 4 64-bit
- Sun Solaris 10

BoKS Reporting Manager Relational Database Support

- Oracle 11g
- mySQL 5.1

Any technical platform that supports these software versions.

Note: For small installations, we would recommend using the same server as the BoKS Reporting Manager Server

Browser Requirements

BoKS Reporting Manager supports the following internet browsers for remote administration and operation:

- Microsoft Internet Explorer 7.0 and later
- Mozilla Firefox 2.0 and later
